

ABSTRACT OF THE DISCLOSURE

A spill-resistant container lid that gives the user the feeling that there is no lid at all. The spill-resistant qualities are achieved by the utilization of cavities located in a liquid shield extending downwardly from the rim of a container. The device also includes a spill-proof cover, which is rotatably alignable allowing for either a closed or open position. The device may also include a spill-proof lid cap that adds increased sanitation value and temperature control. The container lid may be utilized on beverage containers, both disposable and nondisposable, in addition to pots, pans, and the like.
